## I. Questions

### Question 1: Emoji Expressions

Imagine you're analyzing social media posts for sentiment analysis. If you were to create a variable named "postSentiment" to store the sentiment of a post using emojis 🤗 for positive, 😐 for neutral, 😞 for negative, what data type would you assign to this variable? Why? (*narrative type question, no code required*)

**Solution:** I would assign this variable to ordinal character data type. This is because the variable is a single emoji that can be used to represent ordered descriptions

### Question 2: Hashtag Havoc

In a study on trending hashtags, you want to store the list of hashtags associated with a post. What data type would you choose for the variable "postHashtags"? How might this data type help you analyze and categorize the hashtags later? (*narrative type question, no code required*)

**Solution:** The data type I would choose for the variable 'postHashtags' is nominal character data type. This is because the variable is a string of alphabts that do not have any natural ordering.

### Question 3: Time Traveler's Log

You're examining the timing of user interactions on a website. Would you use a numeric or non-numeric data type to represent the timestamp of each interaction? Explain your choice (*narrative type question, no code required*)

**Solution:** I would use a numeric data type to represent the timestamp of each interaction. This is because numeric data type will be able to ensure a more accurate representation and ease of manipulation of the timestamp as compared to non-numeric data.

### Question 4: Event Elegance

You're managing an event database that includes the date and time of each session. What data type(s) would you use to represent the session date and time? (*narrative type question, no code required*)

**Solution:** I would use character data type to represent the session date and numeric data type to represent the session time.

### Question 5: Nominee Nominations

You're analyzing nominations for an online award. Each participant can nominate multiple candidates. What data type would be suitable for storing the list of nominated candidates for each participant? (*narrative type question, no code required*)

**Solution:** The data type that would be suitable for storing the list of nominated candidates for each participant is nominal character data type

### Question 6: Communication Channels

In a survey about preferred communication channels, respondents choose from options like "email," "phone," or "social media." What data type would you assign to the variable "preferredChannel"? (*narrative type question, no code required*)

**Solution:** I would assign the variable "preferredChannel" to nominal character data type

### Question 7: Colorful Commentary

In a design feedback survey, participants are asked to describe their feelings about a website using color names (e.g., "warm red," "cool blue"). What data type would you choose for the variable "feedbackColor"? (*narrative type question, no code required*)

**Solution:** The data type that I would choose for the variable "feedbackColor" is ordinal character data type

### Question 8: Variable Exploration

Imagine you're conducting a study on social media usage. Identify three variables related to this study, and specify their data types in R. Classify each variable as either numeric or non-numeric.

**Solution:** Three variables that can be related to this study is the number of likes, mental health wellbeing and number of followers. The number of likes and number of followers are numeric variables while mental health wellbeing are non-numeric variables.

### Question 9: Vector Variety

Create a numeric vector named "ages" containing the ages of five people: 25, 30, 22, 28, and 33. Print the vector.

**Solution:**

```
x <- c(25, 30, 22, 28, 33)
print(x)
```

```
## [1] 25 30 22 28 33
```

### Question 10: List Logic

Construct a list named "student\_info" that contains the following elements:

- A character vector of student names: "Alice," "Bob," "Catherine"
- A numeric vector of their respective scores: 85, 92, 78
- A logical vector indicating if they passed the exam: TRUE, TRUE, FALSE

Print the list.

**Solution:**

```
x <- list("Alice", "Bob", "Catherine", 85, 92, 78, TRUE, TRUE, FALSE)
print(x)
```

```
## [[1]]
## [1] "Alice"
##
## [[2]]
## [1] "Bob"
##
## [[3]]
## [1] "Catherine"
##
## [[4]]
## [1] 85
##
## [[5]]
## [1] 92
##
## [[6]]
## [1] 78
##
## [[7]]
## [1] TRUE
##
## [[8]]
## [1] TRUE
##
## [[9]]
## [1] FALSE
```

### Question 11: Type Tracking

You have a vector "data" containing the values 10, 15.5, "20", and TRUE. Determine the data types of each element using the typeof() function.

**Solution:**

```
x <- c(10, 15.5, "20", TRUE)
typeof(x)
```

```
## [1] "character"
```

### Question 12: Coercion Chronicles

You have a numeric vector "prices" with values 20.5, 15, and "25". Use explicit coercion to convert the last element to a numeric data type. Print the updated vector.

**Solution:**

```
x <- c(20.5, 15, "25")
x <- as.numeric(x)
typeof(x)
```

```
## [1] "double"
```

### Question 13: Implicit Intuition

Combine the numeric vector c(5, 10, 15) with the character vector c("apple", "banana", "cherry"). What happens to the data types of the combined vector? Explain the concept of implicit coercion.

**Solution:**

```
x <- c(5, 10, 15)
typeof(x)
```

```
## [1] "double"
```

```
x <- c(x, "apple", "banana", "cherry")
typeof(x)
```

```
## [1] "character"
```

**Explanation:** Implicit coercion refers to the automatic conversion of values from one data type to another without explicit instructions. This can be done by adding a different data type into the created vector.

### Question 14: Coercion Challenges

You have a vector "numbers" with values 7, 12.5, and "15.7". Calculate the sum of these numbers. Will R automatically handle the data type conversion? If not, how would you handle it?

**Solution:**

```
x <- c(7, 12.5, "15.7")
x <- as.numeric(x)
sum_x <- sum(x)
print(sum_x)
```

```
## [1] 35.2
```

### Question 15: Coercion Consequences

Suppose you want to calculate the average of a vector "grades" with values 85, 90.5, and "75.2". If you directly calculate the mean using the mean() function, what result do you expect? How might you ensure accurate calculation?

**Solution:**

```
x <- c(85, 90.5, "75.2")
x <- as.numeric(x)
mean_x <- mean(x)
print(mean_x)
```

```
## [1] 83.56667
```

### Question 16: Data Diversity in Lists

Create a list named "mixed\_data" with the following components:

- A numeric vector: 10, 20, 30
- A character vector: "red", "green", "blue"
- A logical vector: TRUE, FALSE, TRUE

Calculate the mean of the numeric vector within the list.

**Solution:**

```
mixed_data <- list(numeric=c(10, 20, 30), character=c("red", "green", "blue"), logic=c(TRUE, FALSE, TRUE))
mean_x <- mean(mixed_data$numeric)
print(mean_x)
```

```
## [1] 20
```

### Question 17: List Logic Follow-up

Using the "student\_info" list from Question 10, extract and print the score of the student named "Bob."

**Solution:**

```
student_info <- list(name=c("Alice", "Bob", "Catherine"), score=c(85, 92, 78), logical=c(TRUE, TRUE, FALSE))
bob_index <- student_info$name=="Bob"
bob_score <- student_info$score[bob_index]
print(bob_score)
```

```
## [1] 92
```

### Question 18: Dynamic Access

Create a numeric vector values with random values. Write R code to dynamically access and print the last element of the vector, regardless of its length.

**Solution:**

```
values <- c(1, 5, 7, 8, 10)
values[length(values)]
```

```
## [1] 10
```

### Question 19: Multiple Matches

You have a character vector words <- c("apple", "banana", "cherry", "apple"). Write R code to find and print the indices of all occurrences of the word "apple."

**Solution:**

```
words <- c("apple", "banana", "cherry", "apple")
apple_indices <- which(words == "apple")
print(apple_indices)
```

```
## [1] 1 4
```

### Question 20: Conditional Capture

Assume you have a vector ages containing the ages of individuals. Write R code to extract and print the ages of individuals who are older than 30.

**Solution:**

```
ages <- c(17, 20, 21, 35, 40, 70)
older_than_30 <- ages[ages > 30]
print(older_than_30)
```

```
## [1] 35 40 70
```

### Question 21: Extract Every Nth

Given a numeric vector sequence <- 1:20, write R code to extract and print every third element of the vector.

**Solution:**

```
sequence <- 1:20
every_third <- sequence[seq(3, length(sequence), by = 3)]
print(every_third)
```

```
## [1] 3 6 9 12 15 18
```

### Question 22: Range Retrieval

Create a numeric vector numbers with values from 1 to 10. Write R code to extract and print the values between the fourth and eighth elements.

**Solution:**

```
numbers <- 1:10
fourth_and_eighth_elements <- numbers[4:8]
print(fourth_and_eighth_elements)
```

```
## [1] 4 5 6 7 8
```

### Question 23: Missing Matters

Suppose you have a numeric vector data <- c(10, NA, 15, 20). Write R code to check if the second element of the vector is missing (NA).

**Solution:**

```
data <- c(10, NA, 15, 20)
missing_data <- is.na(data[2])
print(missing_data)
```

```
## [1] TRUE
```

### Question 24: Temperature Extremes

Assume you have a numeric vector temperatures with daily temperatures. Create a logical vector hot\_days that flags days with temperatures above 90 degrees Fahrenheit. Print the total number of hot days.

**Solution:**

```
temperatures <- c(50, 65, 80, 91, 100)
hot_days <- temperatures > 90
total_hot_days <- sum(hot_days)
print(total_hot_days)
```

```
## [1] 2
```

### Question 25: String Selection

Given a character vector fruits containing fruit names, create a logical vector long\_names that identifies fruits with names longer than 6 characters. Print the long fruit names.

**Solution:**

```
fruits <- c("strawberry", "durian", "banana", "pineapple", "watermelon")
long_names <- nchar(fruits) > 6
long_fruit_names <- fruits[long_names]
print(long_fruit_names)
```

```
## [1] "strawberry" "pineapple" "watermelon"
```

### Question 26: Data Divisibility

Given a numeric vector numbers, create a logical vector divisible\_by\_5 to indicate numbers that are divisible by 5. Print the numbers that satisfy this condition.

**Solution:**

```
numbers <- c(20, 28, 36, 43, 50, 65)
divisible_by_5 <- numbers%%5 == 0
numbers_divisible_by_5 <- numbers[divisible_by_5]
print(numbers_divisible_by_5)
```

```
## [1] 20 50 65
```

### Question 27: Bigger or Smaller?

You have two numeric vectors vector1 and vector2. Create a logical vector comparison to indicate whether each element in vector1 is greater than the corresponding element in vector2. Print the comparison results.

**Solution:**

```
vector1 <- c(2, 3, 5, 8)
vector2 <- c(1, 4, 6, 9)
comparison <- vector1 > vector2
print(comparison)
```

```
## [1] TRUE FALSE FALSE FALSE
```
